New FSAD Study - Now Enrolling

Millions of women struggle to reach or maintain a sufficient physical response to sexual stimulation - a condition known as female sexual arousal disorder (FSAD). FSAD can be especially frustrating for women who have normal levels of sexual desire but difficulty becoming or staying aroused. For many women, FSAD can cause anxiety around sexual interactions with their partner, or lead to sexual avoidance.

While there are multiple FDA-approved therapies for men with sexual arousal disorders, there are currently no FDA-approved therapies for women with FSAD.

Right now, women's health specialists throughout the US are conducting a new research study that may be able to help. The study is for an investigational cream intended to treat FSAD and used in the privacy of your home. If you suspect you have FSAD, this study may be right for you.

If you qualify and choose to join the study, you will be seen by a local women's health specialist and will receive all study-related care and study medication at no cost.

Nearly 20% of women between the ages of 21 - 60 experience low or no sexual arousal, a condition known as FSAD

Why Participate?

FSAD is a common condition that makes it difficult for women to reach or maintain sexual arousal. Doctors at select centers throughout the US are studying an investigational cream intended to treat FSAD and used in the privacy of your own home. If you qualify and choose to participate in the study, you will receive:

- ✓ Evaluations from a local women's health specialist
- ✓ Study-related care and study medication at no cost (health insurance is not required)
- ✓ Compensation up to \$800 for your time and travel to attend study visits (7 visits over an approximate 5-month period)
- ✓ The opportunity to help advance FSAD research to potentially benefit other women suffering from FSAD
